Sharing what Ten10 Junior Consultants are working on

Hello, I am Laura and I am apart of A30! I started my role as a software engineer at NATS a couple of months ago in the software engineering practice. When I started my placement, the aviation industry was a very alien field of work to me – I feel like I have already learnt so much already in such a small period of time! When I started at Ten10, I had originally envisioned myself going into a business analysis or project management role. However, as I worked my way through the core training, I found the technical modules very rewarding, so I was very pleased to be put forward for a developer role.

NATS works in a combination of agile and waterfall methodology, incorporating both flexibility and structure. I have really enjoyed working in this environment as it has allowed me some freedom whilst simultaneously having a clear understanding of objectives. I will be starting to officially work on a project in the new year which I am very excited for. In the meantime, I have been exploring different languages and frameworks that we could be using, such as Qt, C++, TypeScript and React. This has allowed me to start developing a range of valuable skills, but also to settle into my new environment and understand the wider context of what I will be working on before being immersed into a project. I relocated to Southampton for my role, which was a huge change. However, I feel like I have settled in here really well, and I am really excited for my future at NATS and the potential projects I could be working on.

Sharing what Ten10 Junior Consultants are working on

I am testing a new adaption version of software called AMAN HB (Headbranch) that will be soon delivered at Swanick Air traffic control, the software in summary, it calculates planes arriving in sequences to airports such as Gatwick and Heathrow and provides on-time arrival as well as delays. I am conducting manual, functional, regression, and integration testing on my current project.

My client uses agile and waterfall methodologies although my client leans towards waterfall more they are open to a positive constructive change. We also use Linux and Jira.

Marhamat Elahi | Academy 25

I have relocated for my client, typically I am in the office for 4-5 days depending on the project and what testing phase we are in. I have a quick standup with my task manager to gather a scope of my tasks for the day and perform my tasks based on priority.

I am responsible for creating test procedures, conducting tests and writing a quick look test report, when conducting a test any defect I have observed will be raised in Jira.

My biggest challenge working for my client was understanding them as they constantly speak with acronyms, we have an acronym site with over 10752 acronyms that I look at every day to understand the context of the conversation, although it has become fun asking people what the acronyms mean and they just break down as they use those acronyms as common words for years and forget what it stands for,

Being newly part of a team means that you join with a new perspective and mindset, when I joined I was able to raise many defect observations that not many people were able to notice and this helped the project save the cost of fixing before it gets deployed.
