Sharing what Ten10 Junior Consultants are working on

Hello everyone, I am Kelson from A23 and have been working at Equiniti for the past year as a junior DevOps Engineer. My main focus is on achieving continuous delivery, that is, to radically accelerate the pace at which we deliver our software and value to the end users as smoothly as possible. This comes with a lot of challenges, but Equiniti provides us with the tools, flexibility and freedom to be able to improve our processes and deliver quality software. I work remotely in an international team, consisting of engineers from Poland and India.

Kelson Manuel | Academy 23

A typical day for me starts with reading emails, MS teams chat to see if there are any urgent queries or any broken applications. As a team, we follow a Scrumban approach which is a combination of scrum ceremonies along with the visual elements of Kanban to increase our team's agility and productivity.

Afterwards, I liaise with various stakeholders and different teams to deploy our software to the client's environment. I would make a list of issues I would encounter and discuss them during our scrum refinement sessions to find a way to improve the process to avoid impediments so that we can deliver faster. A main part of this involves automation and encouraging the wider team to adopt new ways of working that are more efficient.

The biggest challenge I face is the overwhelming amount of things I need to learn, as DevOps isn't entry-level. However, I have a supportive team that enables me to tackle this slowly by offering excellent mentorship. Overall Equiniti has provided me with a wide range of experience and toolset, and I have enjoyed my time.

Sharing what Ten10 Junior Consultants are working on

Hello everyone. I'm Henry from A25 and I've been working as a test engineer for Flowbird since last April. As a ticketing and parking solutions company, my day to day activities usually involve some kind of system or regression testing on the ticketing software produced at Flowbird. I've also conducted benchmark testing and confirmation testing (known as QA at Flowbird) on fixes for identified bugs.

Henry Scott | Academy 25

Most testing at Flowbird is done using TestRail, which allows the creation of test cases and test runs, while defect management is handled in Jira. While academy training helped me prepare for the general terms and processes of testing, it was still all a new experience to me when I first joined. However I've had great support at Flowbird in understanding their processes and have therefore been able to settle in well.

As Flowbird is based in Poole, I was required to move from my family house in London down to Poole. This was quite challenging for me (having never lived away from home before) to try and find accommodation in a limited timeframe and live with strangers in a flatshare. But I received great support from wellbeing in both finding a place to stay and using AirBnB while I was searching. Looking back at it, I'm also thankful that I didn't initially have a place to stay, as it meant not too many challenging and new things were happening at the same time. I look forward to continue working at Flowbird and meeting the new challenges as they come.
