Sharing what Ten10 Junior Consultants are working on

My department is mostly focused on ensuring that we are compliant with data governance and data protection laws, so for the most part we are writing data protection impact assessments which is interesting as we get to speak with the data scientists and intel analysts to understand how the data is used and ensure it is protected while we have it. We also work closely with the data lab department to ensure that they are delivered data that they require.

One of the projects I am responsible for is running some code which generates reports and I then send the reports out to a large mailing list. I helped to edit the Python code which generates these reports to make the process more efficient which was an interesting project to be involved in. I'm also currently in the process of developing some charts to visualise trends with the data over the past two years.

Whilst on placement with my client, the tools I use the most are Jira, which I had a few training sessions on provided by the client so I now have a good understanding of all the functionality. We also use AWS on a regular basis and received training on use of the AWS CLI so we can interact with AWS without the user interface.

The client requires us to be in the office at least 2 days of the week and I tend to go in 2/3 days as it's good to see the team face to face and also helps to form relationships with other departments also.
