Sharing what Ten10 Junior Consultants are working on

During my time at Rabobank as a DevSecOps Engineer, I have been responsible for maintaining a high-performance computing grid composed of on-premises and cloud servers, with the majority of my work focused on Azure. This grid serves as a robust platform hosting multiple applications, providing clients and users with reliable, scalable compute resources to meet high-demand computational needs.

A typical week involves a hybrid schedule, with two days in the office to facilitate team interactions and three days working remotely

Working within an agile methodology, I contribute to iterative development and collaboration, ensuring that the grid evolves efficiently to meet both functional and security requirements.

My responsibilities include patching compute nodes, developing automation pipelines, and designing and remediating security features. Additionally, I handle critical tasks such as security certificate rotation, ensuring operational continuity and compliance. The role has presented its challenges, particularly navigating a steep learning curve for the diverse tools and applications in use. However, these experiences have sharpened my expertise in key tools and languages, including Azure DevOps, YAML, Python, PowerShell, and various security software.

My biggest achievement thus far has been rewriting the grid application release pipeline to align with new security requirements, a complex task that improved reliability and compliance. I also successfully implemented an automated certificate replacement pipeline, streamlining a previously time-consuming process.

All in all I have learnt an enormous amount, and I look forward to continuing to work on and deliver exciting projects.
