Sharing what Ten10 Junior Consultants are working on

Hi! I'm Jas, and I joined Ten10 at the start of last year as part of Academy 33. I'm currently placed at Royal Mail Group working as a Solutions Analyst. I've been in the role for about 8 months now.

Right now, I'm working on a team that is handling and testing a large scale API migration that is estimated to save the client £100 million a year. This is crucial work because when Royal Mail customers, both large and small, encounter API issues, they can't generate and print their shipping labels. If something goes wrong I debug and test they API calls and develop a solution that keeps them shipping.

This involves interacting with key stakeholders to gather requirements, both within Royal Mail and also their clients, testing using ReadyAPI and interacting with businesses to give feedback.

I like to start my day off with a coffee, before cycling into the office which takes about 15 minutes. Once at my desk, I usually check my emails and calendar before taking part in a daily stand up. Throughout the day, I'll be sending emails, attending calls with customers and testing API's. Some days I'll have side projects to work on, this can include generating test labels within ReadyAPI on the operational side side of the business, training new starters joining the team or creating reports on the migration.

The environment in the office is very welcoming and a fun place to work. You're given the freedom to use your judgment to guide decision making and no day is the same. The biggest achievement with Royal Mail so far has been working on the reporting document that tracks the progress of the migration. This involved creating an Excel report that visualised a large set of data and is regularly looked at by members of the Executive Leadership team at Royal Mail.
