Sharing what Ten10 Junior Consultants are working on

Hi! I'm Deep, and I joined Ten10 in July last year. I'm currently placed at Tokio Marine Kiln, where I work within the QA and technology teams supporting internal business applications.

When I first joined, my main focus was DQPro, a data quality and governance platform. I joined the project with very little prior knowledge, so a lot of my early time was spent learning the application, understanding the business processes, and getting familiar with the existing automation framework. Over time, I've taken ownership of creating and maintaining automated test scripts to support new releases and changes.

This helps ensure the platform remains stable and reliable, while also reducing the need for manual testing.

I've also started working on DATE, a Salesforce-based application. This has been a great opportunity to learn a new system and broaden my experience, while still applying the automation skills I've developed on DQPro.

I work in an Agile environment and start each day with a stand-up to align with the team on progress and priorities. My day-to-day work includes writing and updating automation tests, running test suites, investigating failures, and working closely with developers and stakeholders to resolve issues. I'm in the office three days a week, based at Sky Garden, with the rest of my time spent working remotely.

One of the biggest challenges for me was starting from scratch on DQPro, but this has also become my biggest achievement. Seeing the automation suite grow into something reliable that the team can use confidently has been really rewarding. Overall, the role has helped me build confidence, adaptability, and a strong foundation in test automation.
