Sharing what Ten10 Junior Consultants are working on

I'm currently working at KPMG, where I'm involved in end-to-end testing across several core systems used within the business, including SAP, ProFinda, and Replicon. The purpose of this work is to ensure that these systems function reliably and seamlessly for users, supporting critical business processes and reducing the risk of issues in production.

My role primarily focuses on automation testing, using Java with Playwright. I build and maintain automated test scenarios to validate key user journeys, while also supporting manual testing where required.

This helps improve test coverage, speeds up regression testing, and increases confidence in system changes before release.

The client follows a Kanban methodology, using Jira to manage work. We have daily stand-ups to discuss progress, blockers, and priorities, which helps keep the team aligned and responsive. I spend my day executing tests, reviewing requirements, and joining calls with the wider team.

My responsibilities include ensuring systems behave as expected, identifying and raising defects, and collaborating closely with stakeholders such as Business Analysts and Product Owners to clarify requirements and resolve issues efficiently.

One of the main challenges I faced initially was adapting quickly to the end-to-end testing process and becoming familiar with complex systems early on. However, this was a valuable learning experience and something I was able to overcome with support from the team.

My biggest achievement so far has been how much I've learned over the past six months. Gaining confidence in the systems, growing my technical skills, and learning from experienced colleagues has shown me just how far I've progressed since joining the project.
