Sharing what Ten10 Junior Consultants are working on

Hello, I am Ore from Academy 37. I currently work as a Test Engineer at the Bank of England in a hybrid setup, balancing focused technical tasks with in-person collaboration. My project focuses on testing middleware systems that support critical internal operations including validating how different systems connect and interact, ensuring that data flows correctly and that functionalities meet both technical requirements and user needs.

My team utilises an internal automation framework built with Java, alongside tools such as Jira and Confluence to write test scripts, manage test cases, track defects and document progress. A typical day for me includes writing and maintaining automated test scripts, using behaviour driven development approaches to ensure scenarios clearly reflect business requirements. In addition to this, ensuring that new changes do not impact existing functionality. Working within an Agile environment, I collaborate closely with developers, business analysts, project managers and other testers to identify issues early and maintain quality throughout the delivery process.

A key milestone for me has been growing in confidence with automation, with a strong focus on writing and refining test scripts, while adapting to a highly regulated environment. Alongside my project work, I am preparing for the ISTQB certification and value the opportunity to continuously learn, develop my technical skills and contribute within a supportive team.
