Sharing what Ten10 Junior Consultants are working on

Hi, I'm Danyal from Academy 38, currently working as a Junior Test Consultant at EQ on Project Align.

Project Align is a large transformation programme replacing EQ's legacy pension administration platform with a modern system supporting pensions, payroll, workflows and reporting. The project follows what we call "Wagile" – a hybrid of waterfall and agile. I work within the testing team focusing mainly on payroll workflows.

Danyal Mirza | Academy 38

Payroll testing has a reputation for being quite difficult to grasp (something I quickly heard from others on the project!). I had no prior payroll knowledge when I joined, but I've really enjoyed learning how the system works and understanding the logic behind the workflows.

My role involves designing and executing system test scenarios in Azure DevOps, creating test scripts based on workflow user guides, preparing test data and raising or retesting defects. When I first joined, writing test scripts was completely new to me – I actually started by drafting them in Microsoft Word first to get comfortable with the structure before moving into DevOps.

One challenge has been workflows requiring updates by developers, due to bugs and missing data, meaning scripts needed updating and workflows retesting. While challenging, this massively helped deepen my understanding of the system.

My biggest achievement so far has been receiving positive feedback from fellow testers and the automation team on the clarity of my test scripts, especially considering I had no prior experience. It's been rewarding knowing the work I produce supports testing across the wider team.
