Sharing what Ten10 Junior Consultants are working on

Hello everyone, I'm Mahia from Academy 37, currently placed at NATS as a Test Engineer working as part of the electronic flight data test team. The project I am working on involves a system that displays flight strips which is used by Air traffic controllers to ensure safe and efficient navigation of aircraft through UK airspace.

The project follows a waterfall methodology, meaning many of our test cases and documentation are written before test execution can begin. Some of my responsibilities include writing test procedures, updating regression scripts, executing test scripts and raising defects.

Mahia Ananna | Academy 37

As my project is undergoing a hardware replacement, I have had the opportunity to take part in both functional and non-functional testing. I was also involved in helping my team prepare for a factory acceptance testing (FAT) by collaborating with them to analyse supplier documentation and determine requirement coverage. Participating in these different testing phases has enhanced and deepened my understanding of how the system works.

Some of the tools we use include Jira which is used for defect management. This is where we raise tickets to log any defects identified during test execution. We also use a tool named PleaseReview, where we upload our test documents to be reviewed by our team members and the wider team.

As some of these systems are highly complex in the way they operate, one of my challenges has been becoming familiar with these safety critical systems and the aviation industry itself. Although there was a steep learning curve, my team was always there to support me in overcoming any challenges. It has been a valuable learning experience and I look forward to continuously learning and developing my technical skills.
