Sharing what Ten10 Junior Consultants are working on

Hello there, I'm Richard and I am from Academy 39! I recently joined SSE and have been working as a Junior Telecoms Engineer for the Distribution Operational Technology department within SSE. SSE Plc is separated into several child companies that each operate with similar goals, SSEN Distribution is one of those companies.

This role entails me learning about SSE as a business and where my small role fits in the whole picture of the company. My role is a blend of technical tasks and admin tasks.

Richard Otor | Academy 39

The technical tasks includes getting used to SSE systems, so understanding the hardware that is in every depot and substation and how they work together with the software solutions that have been continuously developed since 1998!

A typical day starts with a short cycle into the office. From there a daily check of a report that is sent to my team by a partner company called NEOS, is conducted. I essentially need to make a record of the report that can be referenced faster during meetings with NEOS. From there I receive tasks from my supervisors which have been upgrading the firmware of routers that are to be sent to substations, or using a software known as Electric Office to update a list detailing SSE locations that are due for an upgrade, among others.

As critical national infrastructure, SSE uses a wide range of bespoke software that I have been becoming familiar with since starting with SSE. These include the Vodafone Internet of Things portal, OT Ctrix, PowerON, Essendex, and Iris, among others, these all come together to allow SSE to remotely see and control their whole network, and it's an achievement to be able to use them effectively at my stage in training for this role.
